PRISM EPS Submission Information

PRISM EPS screens are a 10-day assay offering for DMSO-soluble compounds only in a single-agent format. These screens are run using our EPS design: 10-day assay, 900+ cell lines, test agents run at 8 pt. dose, with 3-fold dilutions in 4 replicates. Collaborators select the top screening dose as part of the screen submission process. Additional workflow information can be found on the PRISM website

Test Agent Requirements:

- We require at least 500µL at 1000X the top screening dose in 100% DMSO.
    - i.e. If your top screening dose is 10µM, you will submit a 10mM stock.
- The collaborator is responsible for ensuring that the test agent is soluble in 100% DMSO at the stock concentration and for QC'ing test agents ahead of submission.
    - We do not have the bandwidth to do any optimization for, or re-running of, test agents that do not perform well in PRISM. Any test agents submitted will be run 'at-risk'
    - We are unable to solubilize powdered stock of compounds for collaborators.
